RFID antennas vary considerably in their design dependent upon the frequency, coupling type and whether they are used in the tag or the reader / writer. The requirements and parameters vary considerably according to the specific application. The design can be quite interesting because often space is a major limitation and performance is, as with any antenna, key. As a result the

RFID antenna often needs careful optimisation to ensure the best performance.

A typical RFID tag consists of an antenna and an integrated circuit (chip), both with complex impedances. The chip obtains power from the RF signal transmitted by the base station, called the RFID reader. The RFID tag antenna is loaded with the chip whose impedance switches between two impedance states, usually high and low.
