Since the dc bus voltage is a function of the peak voltage, the overshoot causes the dc bus voltage to exceed the over voltage setting, which results in the drive tripping off line. The solution in this

application was to install a properly sized line reactor in the plant's electrical supply to the drive.

We lack standards for DC distribution voltage levels. Generally, the grid has to operate at a relatively high voltage of, say, 380V, so current levels remain relatively low and minimal losses happen over the wiring infrastructure. Meanwhile, that grid voltage has to be dropped into the 24-60V range for LED lighting and to 12V for electronics.
