Abstract: The next generation of spectroscopic surveys will target emission-line galaxies (ELGs) to produce constraints on cosmological parameters. We study the large scale structure traced by ELGs using a combination of a semi-analytical model of galaxy formation, a code that computes the nebular emission from HII regions using the properties of the interstellar medium, and a large-

volume, high-resolution N-body simulation.

The X-SHOOTER/ALMA sample of Quasars in the Epoch of Reionization. I. NIR spectral modeling, iron enrichment and broad emission line properties. We present X-SHOOTER near-infrared spectroscopy of a large sample of 38 luminous (to) quasars at , which have complementary CII observations from ALMA. This X-SHOOTER/ALMA sample provides us with the most comprehensive view of reionization-era quasars to date, allowing us to connect the quasar properties with those of its host galaxy.

In general, emission lines occur in gases that are optically thin, or in atmospheres that have a temperature inversion (i.e. are hotter closer to the observer). In an optically thin gas, if excited atoms or ions are radiatively deexcited, then the photons produced can escape to an observer.
