Process Specification for the Resistance Spot Welding of ...

The simplest form of the process is spot welding where the pressure is provided by clamping two or more overlapping

sheets between two electrodes (Fig. 9.1). A current is then passed between the electrodes, sufficient heat being generated at the interface by resistance to the flow of the current that melting occurs, a weld nugget is formed and an autogenous fusion weld is made between the plates. The heat generated depends upon the current, the time the current is passed and the resistance at ...

Resistance Welding - an overview | ScienceDirect Topics

A form of resistance welding, spot welding is one of the oldest welding processes whereby two or more sheets of metal are welded together without the use of any filler material. The process involves applying pressure and heat to

the weld area using shaped alloy copper electrodes which convey an electrical current through the weld pieces.

What is Spot Welding? (A Complete Welding Process Guide)

Resistance Spot Welding Spot welding is a resistance welding process for joining metal sheets by directly applying opposing forces with electrodes with pointed tips. The current and the heat generation are localized by the form of the electrodes. The weld nugget size is usually defined by the electrode tip contact area.

Today we will learn about resistance welding principle, types, application, advantages and disadvantages.

Resistance welding is a liquid state welding process in which the metal to metal joint created in liquid or molten state. It is a thermo-electric process in which heat is generated at the interface surfaces of welding plates due to electric resistance and a controlled low pressure is applied to these plates to create a weld joint.

Resistance Welding : Principle, Types, Application ...

Spot welding is a type of electric resistance welding used to weld various sheet metal products, through a process in which contacting metal surface points are joined by the heat obtained from resistance to electric current. The process uses two shaped copper alloy electrodes to concentrate welding current into a small "spot" and to simultaneously clamp the sheets together. Work-pieces are held together under pressure exerted by electrodes. Typically the sheets are in the 0.5 to 3 mm thickness r

resistance spot welding working process & its application ...

Definition of Resistance Welding □ Resistance welding is a fusion welding process in which coalescence of metals is produced at the faying surfaces by the heat generated at the joint by the resistance of the work to the flow of electricity. □ Force is applied before,

during, and after the application of current to prevent arcing at the work piece. □ Melting occurs at the faying surfaces during welding.
