Optics of the atmosphere. Scattering by molecules and ...

Scattering is a term used in physics to describe a wide range of physical processes

where moving particles or radiation of some form, such as light or sound, is forced to deviate from a straight trajectory by localized non-uniformities in the medium through which they pass. In conventional use, this also includes deviation of reflected radiation from the angle predicted by the law of reflection. Reflections of radiation that undergo scattering are often called diffuse reflections and unscattered

Scattering - Wikipedia

Atmospheric optics is "the study of the optical characteristics of the atmosphere or products of atmospheric processes [including] temporal and spatial resolutions beyond those

discernible with the naked eye". Meteorological optics is "that part of atmospheric optics concerned with the study of patterns observable with the naked eye". Nevertheless, the two terms are sometimes used ...

of skylight. Because the atmosphere is rarely, if ever, entirely free of particles, the general characteristics of scattering by particles follow, setting the stage for a discussion of atmospheric visibility. Atmospheric refraction usually sits by itself, unjustly isolated from all those atmospheric phenomena embraced by the term scattering.

Optics Of The Atmosphere Scattering By Molecules And Particles

As light passes through the atmosphere, the blue colors are scattered out of the path. Red and orange light passes through the atmosphere and is refracted into the shadow zone. Multiple scattering occurs when a ray of light interacts with a multitude of particles. Multiple scattering destroys colors. Examples of multiple scattering include: Milk Clouds

ATMOSPHERIC OPTICS - SSEC, UW-Madison

Atmospheric Optics
Light playing on water drops, dust or ice crystals in the atmosphere produces a host of visual spectacles - rainbows, halos, glories, coronas and many more. Some can be seen almost every day or so, some are once in a lifetime sights. Find out where

to see them and how they are formed.

Atmospheric Optics

Atmospheric optics is nearly synonymous with light scattering, the only restrictions being that the scatterers inhabit the atmosphere and the primary source of their illumination is the sun. Essentially all light we see is scattered light, even that directly from the sun.
