Percent Difference: $\frac{|x_1 - x_2|}{(x_1 + x_2)/2} \times 100$ $\frac{|2.21 - 2.40|}{(2.21 + 2.40)/2} \times 100 = 8.2\%$. Conclusion: In conclusion, we can see that radius, mass, and frequency of the rotation affected the centripetal force.

The period and force were measured from 0-26 seconds, as shown in graph 2, to obtain the minimum value of force and be assured that the period was constant over the course of the trial. The measured minimum value for force was found to be .15N and the mean period was found to be 1.375 seconds.

Centripetal Force Experiment: Lab Analysis

Centripetal force is the required force to

keep any object in accelerated motion within a curved path. This force is directed towards the center of path's curvature and depends on the radius constant speed, and mass from the path's center. Within this lab the role in circular motion of radius, mass and centripetal force is tested in three different conditions. The speed is then obtained from the average time it takes in completing a complete circle.

Physics Lab Report - CENTRIPETAL FORCE - PHYS 1441 - StuDocu

The centripetal force would need to decrease. This is because the radius is in the denominator and increasing the denominator with a constant numerator (mass and velocity) causes the quotient (centripetal force) to decrease.

Conclusion This was a very successful lab overall.

VIII. Conclusions: The collected data shows that there is a relationship between the orbital radius of an object and its centripetal force. The collected data and graph show that the radius is inverse cubically proportional to centripetal force. So as the radius increases and mass and velocity remain the same, the centripetal force will decrease.

LAB REPORT: Centripetal Acceleration (CFA)

The magnitude of the centripetal force required to keep an object in a circular path depends on the inertia (or mass) and the acceleration of the object, as you know from the second law ($F = ma$). The acceleration of an object moving in uniform circular motion is $a = v^2/r$, so the magnitude of the centripetal force of an object with a mass (m) that is moving with a velocity (v) in a

Centripetal acceleration is the force that we feel when an object is undergoing an uniform circular motion such as when going around a curve, or on a loop to loop roller coaster. It is the force that keeps an object in a circular motion. Without it, Earth would move in a straight line and satellites would fall out of the sky.
