Centrifugal Compressors : Principles, Operation And Design

Centrifugal compressors run at speeds between 20,000 and 30,000 RPM. They are typically engine or turbine driven. Turbines are commonly used due to high rotating speeds. Centrifugal compressors are used in pipeline booster service where high volume and low compression ratios exist. They are also used in very high flow rate gas lift service.

[PDF] Centrifugal Compressor Evolution | Semantic Scholar

A centrifugal compressor is a dynamic compressor with a radial design. Gaseous Fluid enters the center of a rotating impeller with radial blades and is pushed toward the center by centrifugal force which results in a pressure rise and increases in kinetic energy. This energy is then converted into pressure by passing through a diffuser and volute.

Difference between Centrifugal and Reciprocating Compressor

From the above results, the discrimination of calculated centrifugal compressor losses in: internal losses (ΔH_{int}), parasitic losses (ΔH_{par}) and diffuser losses (ΔH_{dif}) was performed and is shown in Fig. 3.It can be seen that the internal losses are the most important in this type of compressors; however, for centrifugal compressors reported by Danish 17 and Krain et al., 18 these losses ...

In this situation, in order to assess compressor performance, it is necessary to adjust the design performance to operative conditions, taking into account the complexity of the problem and then compare that to measured values. This is basically the approach indicated on the ASME PTC10 (Performance Test Code on Compressors and Exhausters) standard.
